

I have been an amateur radio operator for 43 year and have been active on 160 meters, on and off, since 1966. I have made over 5000 2-way contacts in nearly 300 different "countries" using CW, SSB, and AM on 160. I firmly support RM10352 and believe that 160 should have a separate sub-band for exclusive narrow-band use. CW has demonstrated, over and over again, to be the mode of communications that will get through when no other modes will. Because of the unique propagation characteristics on 160 meters, a small sub-band should be established for the exclusive use of narrow-band modes to promote weak signal experimentation and studies.

Sincerely,

Kenneth N. Bolin W1NG
